

PROJECT DESIGN PHASE I

SOLUTION ARCHITECTURE

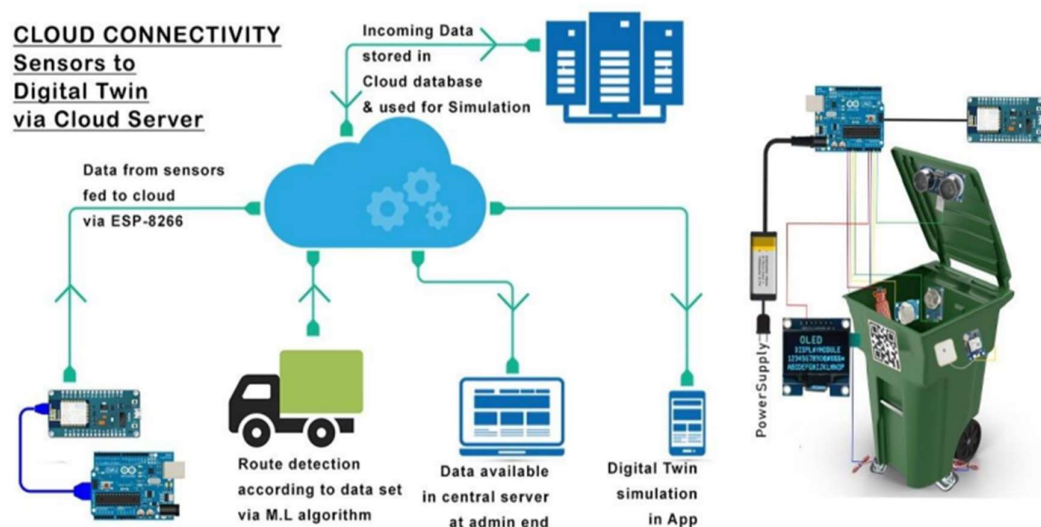

TEAM ID: PNT2022TMID21674

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Our solutions are,

- To establish a smart and efficient waste management system with necessary architecture.
- That architecture includes GPS service, cloud service and collection of data from various locations in the city.
- This architecture bridges gap between a creator and a problem structure.
- Here you can see Arduino boards with codes to particularize the information and various sensors have been used to monitor bin activity.
- We can have twin simulation in both app and web server.
